Developer Reference

Developer Reference

GroundWork Monitor can integrate data from other systems including *GroundWork Hub's* monitoring of *Amazon AWS*, *Cloudera*, *Docker*, *Icinga 2*, *NetApp*, *OpenStack*, *Red Hat Enterprise Virtualization (RHEV)*, and *VMware vSphere*. Typically the integration is done API-to-API. The GroundWork RAPID-based feeders integrate other systems such as *Cacti*, *Microsoft SCOM*, *Elasticsearch* and *Kibana*.

This section includes detailed documentation for GroundWork Foundation - an IT management data abstraction layer and development platform, various API's, and third party data integration, and RAPID-based Feeders. You can also find reference to custom configuration for various GroundWork Monitor applications including *Event Console*, *Insight Reports*, and *Status*.

For detailed information expand ⊞ **Developer Reference** in the navigation pane or select from the links below:
