

# How to enable performance eventhandler logging

## Enabling performance eventhandler logging

1. Edit the file:

```
/usr/local/groundwork/nagios/eventhandlers/process_service_perf_db_file
```

2. Change:

```
my $debug = 0
```

to:

 Don't forget to set this back to "0" when you finish troubleshooting

```
my $debug = 3
```

3. After 5 minutes or so this should create the file:

```
/usr/local/groundwork/nagios/eventhandlers/process_service_perf.log
```

4. Next, search through this log file for the name of the service you are troubleshooting.
