

RAPID-based Feeders

RAPID-based Feeders

This section describes a class of GroundWork applications called *RAPID-based feeders*, which integrate other systems into GroundWork Monitor.

RAPID is a Perl API for the GroundWork REST API. It allows for fast development of systems applications that can manipulate the GroundWork data model and more. The documentation is organized into sections including *Architecture, operation and configuration of each RAPID feeder, RAPID Feeder Commonalities (operation, configuration, etc), and RAPID Developers Guide.*

For detailed information expand  **RAPID-based Feeders** in the navigation pane or select from the links below:
