

# How to generate Availability Reports data

WAS THIS PAGE HELPFUL? [Leave Feedback](#)

## Overview

This page review how to generate data for Availability Reports after installation. Immediately following a GroundWork Monitor installation there will not be any data displayed for Availability Reports. The data for these reports are generated by the `dashboard_data_load.pl` and `dashboard_avail_load.pl` scripts which normally run once a day, at night, as a cron job. This is the expected behavior. These scripts can be executed manually to generate data earlier if required.

## Steps

1. The two scripts are located in directory:

```
/usr/local/groundwork/core/reports/utils
```

2. The cronjob is in the crontab for the user `nagios`. It can be viewed by typing the following command:

```
crontab -l -u nagios
```

3. It should show the following:

```
50 23 * * * /usr/local/groundwork/core/reports/utils/dashboard_data_load.pl >  
/usr/local/groundwork/core/reports/utils/log/dashboard_data_load.log 2>&1 0 1 * * *  
/usr/local/groundwork/core/reports/utils/dashboard_avail_load.pl >  
/usr/local/groundwork/core/reports/utils/log/dashboard_avail_load.log 2>&1
```
